Performance of Corn Hybrids in Louisiana, 2010

**H.J. “Rick” Mascagni, Jr., Brooks Blanche, Millie Deloach, Bobby Golden, Jim Hayes,
John Kruse, Roger Leonard, and Boyd Padgett**

Performance of corn hybrids is annually evaluated by Louisiana Agricultural Experiment Station (LAES) researchers. The purpose of these trials is to provide to Louisiana growers, seedsmen, county agents of the Louisiana Cooperative Extension Service (LCES), and other interested individuals and organizations with unbiased performance data for commercial corn hybrids submitted for evaluation by private agencies.

The cooperating LAES units in 2010 were: Dean Lee Research Station, Alexandria; Red River Research Station, Bossier City; Northeast Research Station, St. Joseph; and Macon Ridge Research Station, Winnsboro. The trial at Bossier City was dropped due to excessive variability among plots.

PROCEDURES

In 2010, 88 corn hybrids were entered in the LAES yield trials. Soil type, cultural practices, location summaries, and weather graphs are listed prior to data tables for each location. In weather graphs, maximum and minimum temperatures are weekly averages and rainfall weekly totals. At St. Joseph, trials were conducted both on Commerce silt loam and Sharkey clay Mississippi River alluvial soils. The Sharkey clay and Winnsboro trials were irrigated.

The experimental design at each location was a randomized complete block design with four or five replications. Traits measured and rating scales are listed in Table 1. Analysis of variance and least significant differences (LSD) were computed using SAS (Statistical Analysis System). We used the protected F-test, which means LSD's were calculated only if differences among hybrids existed at the 90% confidence level. If differences were significant, an LSD at the 10% probability level was calculated. If the LSD (0.10) for yield in a trial is 10 bu/acre, there is a 10% chance that two hybrids with a reported yield difference of 10 bu/acre are genetically equal and a 90% probability they have differences in genetic potential in that particular environment. LSD values are influenced by how well soil fertility, stand establishment, plot length, harvest efficiency, and other variables are controlled and by number of replications for each hybrid. The letters NS are used in the text and tables to indicate lack of significance (**not significantly different**) at the 10% probability level. The coefficient of variation (CV) reflects the magnitude of experimental error (random variation not accounted

H.J. “Rick” Mascagni, Jr., Professor and Coordinator, Northeast Research Station, St. Joseph, LA 71366; Brooks Blanche, Millie Deloach, and John Kruse, Assistant Professor, Research Associate, and Assistant Professor/Specialist, Dean Lee Research Station, Alexandria, LA 71302; Bobby Golden and Jim Hayes, Assistant Professor and Research Associate, Red River Research Station, Bossier City, LA 71113; Roger Leonard and Boyd Padgett, Professors, Macon Ridge Research Station, Winnsboro, LA 71295.

for by hybrids and replications) in relation to the trial mean. A high CV means that relative differences among hybrids were not consistent among replications, which reduces the precision of a test.

Yields for 2010 and two-year averages (2009 and 2010) are presented in the data tables. To be considered for a two-year average, hybrids must have the same seed traits each year (refer to Table 7). Yields for the hybrids in the highest-yielding group for 2010 (yields falling within one LSD value) are in bold print. Hybrids in bold print with a single asterisk are in the highest-yielding group for both years, 2009 and 2010; however, there were no hybrids falling within the highest-yielding group for both years at any location.

Table 1. Traits and rating scales for LAES corn performance trials.

Trait	Abbreviation	Description
Yield	Yield	Grain yield @ 15.5% harvest grain moisture, bu/a (2010)
2-Year average yield	2-Year avg	Average grain yield for 2009 and 2010, bu/a
Grain moisture	GrMo	Grain moisture at harvest, %
Test weight	Test wt	Volume weight of grain, lb/bu
Plant population	Stand	Plant count at harvest, plts/a
Mid-silking date	Mid silk	Date of silk emergence in 50% of plants in plots, days after planting (DAP)
Plant height	Plant ht	Height from ground to flag leaf, in
Ear height	Ear ht	Height from ground to where primary ear attaches to the plant, in
Husk cover	Husk cover	Measure of how well the kernels are covered by the husk, with ratings of 1-3; 1-closed and 3- open husk
Lodging	Lo	Estimate of lodged plants, %

RESULTS

Yield data and other agronomic data for each location are presented in Tables 2-5. A location summary, soil type, cultural practices, and weather information are listed prior to data tables for each location. Yield summary across Louisiana for 2010 is presented in Table 6, seed traits and hybrid maturities are listed in Table 7, and participating seed companies are listed in Table 8. There were thirteen seed companies that participated in the 2010 corn hybrid performance trials.

For additional information on corn trials, please contact Dr. Rick Mascagni, Northeast Research Station, P.O. Box 438, St. Joseph, LA 71366 (Ph: 318-766-3769; Fax: 318-766-4278; e-mail: hmascagni@agcenter.lsu.edu); or the coordinator at a specific location, Dr. Brooks Blanche, Dean Lee Research Station, Alexandria, LA 71302 (Ph: 318-473-6524, Fax: 318-473-6535, e-mail: sblanche@agcenter.lsu.edu); Dr. Bobby Golden, Red River Research Station, Bossier City, LA 71113 (Ph: 318-741-7430, Fax 318-741-7433, e-mail: bgolden@agcenter.lsu.edu).

Corn Hybrid Performance Trial at the Dean Lee Research - Alexandria

Location Summary

This trial was replanted due to extensive bird damage in the first planting date. Although planted relatively late yields ranged from 108.8 to 156.9 bu/a with a trial average of 129.9 bu/a (Table 2). There was early season drought stress in this dryland trial. Rainfall was extremely low in April through mid-May (see weather graph below). There were five hybrids that fell within the 2010 high-yielding group. There were 26 hybrids that had two-year averages, however none of these fell within the high-yielding group for both 2009 and 2010. Data for other agronomic traits are presented in Table 2.

Soil Type.....Norwood silt loam
 Tillage.....
 Stale seedbed with no spring cultivation
 Row Spacing.....38 inch
 Seeding Rate.....32,000 seed/a
 Previous crop.....Soybeans
 Planting date.....April 8 (replant)
 Fertilization..... Fall: 180 lb 0-18-36;
 Sidedress: 200 lb/N (30-0-0-2) plus 0.5
 lb Zn/a;
 Pesticides.....Atrazine @ 1 qt/a, Prowl
 @ 1.5 pt/a, Permit @ 0.75 oz/a (applied 5/21);
 Karate @ 2.6 oz/a (at planting); Lexar @ 3 qt/a
 (applied 4/23);
 Harvest Date.....August 23

¹Yields in bold denote hybrids that are in the highest-yielding group in 2010.

Corn Hybrid Performance Trial on Commerce silt loam at the Northeast Research Station – St. Joseph

Location Summary

Yields ranged from 71.9 to 134.3 bu/a with an overall average of 109.5 bu/a in this dryland trial (Table 3). Yields were relatively good considering the extremely low rainfall in April, May, and June (see weather graph below). There were sixteen hybrids that fell within the 2010 high-yielding group and no hybrids fell within the high-yielding group for both years, 2009 and 2010. Harvest grain moistures ranged from 13.7 % for Dekalb DKC62-54 to 18.9% for B-H Genetics BH 4920HX, reflecting the differences in maturity among hybrids. Most of the hybrids in the trial had a husk cover (HC) rating of 1, which indicates a closed HC. A tight or closed HC is a desirable agronomic trait, since this helps to mitigate insect damage and the accumulation of aflatoxin.

Soil Type.....	Commerce silt loam
Tillage.....	Rehipped in fall, no cultivation
Row Spacing.....	40 inches
Seeding Rate.....	32,000 seed/a
Previous crop.....	Cotton
Planting date.....	March 18
Fertilization.....	
Sidedress:	210 lb N/a (30-0-0-2) (April 9)
Pesticides.....	
Burndown:	Glyphos @ 1 qt/a, 2-4,D @ 13 oz/a;
Pre-emerge:	Atrazine @ 1.5 qt/a, Glyphos @ 1 qt/a, Harness @ 1.5 pt/a, Discipline @ 1.5 oz/a;
Post-emerge:	Steadfast @ 0.75 oz/a, Atrazine @ 1 qt/a, plus 1% COC (April 5);
Harvest Date.....	August 5

¹Yields in bold denote hybrids that are in the highest-yielding group in 2010.

Corn Hybrid Performance Trial on Sharkey clay at the Northeast Research Station – St. Joseph

Location Summary

Rainfall was extremely low in April, May, and June (see weather chart below), resulting in seven furrow irrigations (May 4, May 19, May 27, June 10, June 21, June 28, and July 7). At the first irrigation, corn was at the 8-leaf growth stage. Yields were much lower than expected, ranging from 65.3 to 133.5 bu/a, with a trial average of 109.2 bu/a (Table 4). Adjacent trials, which averaged 140-150 bu/a, had the same irrigation dates; however, these trials were planted April 1 compared to March 19 for the hybrid trial. There were 13 hybrids that fell within the 2010 high-yielding group and no hybrid did well in both years, 2009 and 2010.

Soil Type.....Sharkey clay
 Tillage.....
 Stale seedbed with no cultivation
 Row Spacing.....40 inches
 Seeding Rate.....32,000 seed/a
 Previous crop.....Cotton
 Planting date.....March 19
 Fertilization.....
 Sidedress: 230 lb N/a (30-0-0-2) (April 9)
 Pesticides.....
 Pre-emerge: Atrazine @ 1.5 qt/a, Glyphos @ 1 qt/a, Harness @ 1.5 qt/a, Discipline @ 1.5 oz/a;
 Post-emerge: Atrazine @ 1 qt/a, Steadfast @ 0.75 oz/a plus COC 1%;
 Harvest Date.....August 3

¹Yields in bold denote hybrids that are in the highest-yielding group in 2010.

Corn Hybrid Performance Trial at the Macon Ridge Research Station Winnsboro

Location Summary

Rainfall was very low in June (see weather chart below). Seven furrow irrigations were applied (May 11, May 20, June 11, June 17, June 24, July 14, and July 22). Yields ranged from 96.1 to 157.3 bu/a with a trial average of 123.2 bu/a (Table 5). Lodging was extensive in this trial due to a late-season storm. Most of the lodging resulted from stalk lodging. Harvesting speed had to be slowed for the downed corn with most of the corn being harvested. There were six hybrids that fell into the 2010 high-yielding group and no hybrid did well for both years, 2009 and 2010. Data for other agronomic traits other than yield are presented in Table 5.

Soil Type.....	Gigger silt loam
Tillage.....	Spring tillage and cultivation
Row Spacing.....	40 inches
Seeding Rate.....	32,000 seed/a
Previous crop.....	Cotton
Planting date.....	March 17
Fertilization.....	
	Sidedress: 200 lb N/a (30-0-0-2)
Pesticides.....	
	Pre-emerge: Atrazine @ 1.0 qt/a, Dual @ 1.0 pt/a, Discipline @ 2 oz/a;
	Post-emerge: Atrazine @ 1 qt/a, Round-up @ 1.0 qt/a;
Harvest Date.....	August 12-13

¹VT3 – RR2, Bt1, Bt2 (corn stalk borers, corn rootworm)

VT3Pro – RR2, Bt1, Bt2 (corn stalk borers, corn rootworm, corn earworm)

GenVT3Pro – RR2, Bt1, Bt2 (corn stalk borers, corn rootworm, corn earworm, fall army worm)

HX1 – LL, corn stalk borers, fall army worm

HXXT – HX1 plus corn rootworm

RHXT – RR plus HXXT

GT – Glyphosate tolerant

Bt11 – LL, corn stalk borers

3000GT – LL, GT, corn stalk borers, corn rootworm

NOTE: Corn rootworm resistance provided in all of the above traits do not provide resistance to the southern corn rootworm, which is the pest present in Louisiana.

Table 8. List of participating seed companies and hybrids tested in the LAES 2010 corn hybrid performance trials.

Company	Hybrids
